Eco-lution Group Heralding the Introduction of Their 100% Ecologically Superior Hardwood for Winter Fire Places

Ottawa, Canada, 29, October 2012 - with 11 years of experience in the ecological log industry, Eco-lution Group offers ecological firewood directly from their manufacture's warehouse at most affordable rates. Their status as an industry leader in this profession makes sure that you get highly efficient ecological logs that serve you well in summer and in winter. The clean combustion of the logs is a direct result of their superior performance, made from 100% wood residues, which accounts for less carbon monoxide and 50% less smoke. The net result is less tar, less ash, and less pollution, which all serve together to protect our planet.

The Eco-lution Group has been working on a sound, vision responsibly to manage the existing human resources and to give back to mother earth and the forests the essential resources required for their sustainability and durability. They claim that their sound principle of *reduction* of wood consumption in the forest, *reusing* the sawdust of the wood to create a compressed log and the *recycling* process, are all aimed at appeasing the otherwise rampant rape of mother earth. The four great advantages that emerge from using the compressed logs are, service to humanity, reduction in deforestation and pollution, the lower price and supply straight from the manufacturing warehouses, thus eliminating the layers of price build-up.

On the energy front, Eco-lution ecological wood provides you energy from the environment, without felling of trees (estimated that one skid of these logs represents 12 mature trees in the forest), and this energy is both renewable and inexpensive. In other words, your fireplaces will enjoy a revolutionized heating process with this ecological wood, made only of a guaranteed 100% wood residue, positively reducing the rampant production of greenhouse gases and with far less pollution when compared with cordwood. Additionally, the ash production and the smog effect stay low, with 50% less carbon monoxide and visible smoke.

The other major advantages attributed to ecological wood are its low-water content of 6-8%, which accounts for clean flame and compression and produces three times more heat than the normal wood with consistent values giving you an assured option. They do not crackle or throw sparks, their low to nil creosote content does not call for large chimneys, and no human intervention is necessary.

Available throughout the year you need not stock a year supply as they have easy deliveries, and they are easy to handle and store.

Eco-lution in Canada provides ideal smokeless, high-heat, less environmentally damaging compressed density logs made from sawdust, after the principles of "reduce, reuse, and recycle," which not only save much cost of the consumers, because of the direct supply of the logs from the factory warehouses. This also accounts for a health reduction the uncontrolled pollution of the planet. Visit www.ecolutioncanada.com and learn about the advantages of using their compressed logs.
